

DSP56002

24-BIT DIGITAL SIGNAL PROCESSOR

The DSP56002 is a MPU-style general purpose Digital Signal Processor (DSP) composed of an efficient 24-bit DSP core, program and data memories, various peripherals, and support circuitry. The DSP56000 core is fed by on-chip Program RAM, and two independent data RAMs. The DSP56002 contains a Serial Communication Interface (SCI), Synchronous Serial Interface (SSI), parallel Host Interface (HI), Timer/Event Counter, Phase Lock Loop (PLL), and an On-Chip Emulation (OnCE™) port. This combination of features, illustrated in **Figure 1**, makes the DSP56002 a cost-effective, high-performance solution for high-precision general purpose digital signal processing.

Data Sheet Conventions

This data sheet uses the following conventions:

<u>OVERBAR</u>	Used to indicate a signal that is active when pulled low (For example, the <u>RESET</u> pin is active when low.)
“asserted”	Means that a high true (active high) signal is high or that a low true (active low) signal is low
“deasserted”	Means that a high true (active high) signal is low or that a low true (active low) signal is high

Examples:	Signal/Symbol	Logic State	Signal State	Voltage¹
	$\overline{\text{PIN}}$	True	Asserted	$V_{\text{IL}}/V_{\text{OL}}$
	$\overline{\text{PIN}}$	False	Deasserted	$V_{\text{IH}}/V_{\text{OH}}$
	PIN	True	Asserted	$V_{\text{IH}}/V_{\text{OH}}$
	PIN	False	Deasserted	$V_{\text{IL}}/V_{\text{OL}}$

Note: Values for V_{IL} , V_{OL} , V_{IH} , and V_{OH} are defined by individual product specifications.

FEATURES

Digital Signal Processing Core

- Efficient 24-bit DSP56000 core
- Up to 40 Million Instructions Per Second (MIPS), 25 ns instruction cycle at 80 MHz; up to 33 MIPS, 30.3 ns instruction cycle at 66 MHz
- Up to 240 Million Operations Per Second (MOPS) at 80 MHz; up to 198 MOPS at 66 MHz
- Performs a 1024-point complex Fast Fourier Transform (FFT) in 59,898 clocks
- Highly parallel instruction set with unique DSP addressing modes
- Two 56-bit accumulators including extension bits
- Parallel 24×24 -bit multiply-accumulate in 1 instruction cycle (2 clock cycles)
- Double precision 48×48 -bit multiply with 96-bit result in 6 instruction cycles
- 56-bit addition/subtraction in 1 instruction cycle
- Fractional and integer arithmetic with support for multiprecision arithmetic
- Hardware support for block-floating point FFT
- Hardware nested DO loops
- Zero-overhead fast interrupts (2 instruction cycles)
- Four 24-bit internal data buses and three 16-bit internal address buses for maximum information transfer on-chip

Memory

- On-chip Harvard architecture permitting simultaneous accesses to program and two data memories
- 512×24 -bit on-chip Program RAM and 64×24 -bit bootstrap ROM
- Two 256×24 -bit on-chip data RAMs
- Two 256×24 -bit on-chip data ROMs containing sine, A-law, and μ -law tables
- External memory expansion with 16-bit address and 24-bit data buses
- Bootstrap loading from external data bus, Host Interface, or Serial Communications Interface

Peripheral and Support Circuits

- Byte-wide host interface (HI) with Direct Memory Access (DMA) support (or fifteen Port B GPIO lines)
- SSI support:
 - Supports serial devices with one or more industry-standard codecs, other DSPs, microprocessors, and Motorola-SPI-compliant peripherals
 - Asynchronous or synchronous transmit and receive sections with separate or shared internal/external clocks and frame syncs
 - Network mode using frame sync and up to 32 software-selectable time slots
 - 8-bit, 12-bit, 16-bit, and 24-bit data word lengths
- SCI for full duplex asynchronous communications (or three additional Port C GPIO lines)
- One 24-bit timer/event counter (or one additional GPIO line)
- Double-buffered peripherals
- Up to twenty-five General Purpose Input/Output (GPIO) pins
- One non-maskable and two maskable external interrupt/mode control pins
- On-Chip Emulation (OnCE™) port for unobtrusive, processor speed-independent debugging
- Software-programmable, Phase Lock Loop-based (PLL) frequency synthesizer for the DSP core clock with a wide input frequency range (12.2 KHz to 80 MHz)

Miscellaneous Features

- Power-saving Wait and Stop modes
- Fully static, HCMOS design for specified operating frequency down to dc
- Three packages available:
 - 132-pin Plastic Quad Flat Pack (PQFP); $1.1 \times 1.1 \times 0.19$ inches
 - 144-pin Thin Quad Flat Pack (TQFP); $20 \times 20 \times 1.5$ mm
 - 132-pin Ceramic Pin Grid Array (PGA); $1.36 \times 1.35 \times 0.125$ inches

PRODUCT DOCUMENTATION

The three documents listed in the following table are required for a complete description of the DSP56002 and are necessary to design properly with the part. Documentation is available from one of the following locations (see back cover for detailed information):

- A local Motorola distributor
- A Motorola semiconductor sales office
- A Motorola Literature Distribution Center
- The World Wide Web (WWW)

Table 1 DSP56002 Documentation

Name	Description	Order Number
DSP56000 Family Manual	Detailed description of the DSP56000 family processor core and instruction set	DSP56KFAMUM/AD
DSP56002 User's Manual	Detailed functional description of the DSP56002 memory configuration, operation, and register programming	DSP56002UM/AD
DSP56002 Technical Data	DSP56002 features list and physical, electrical, timing, and package specifications	DSP56002/D

SECTION 1

SIGNAL/PIN DESCRIPTIONS

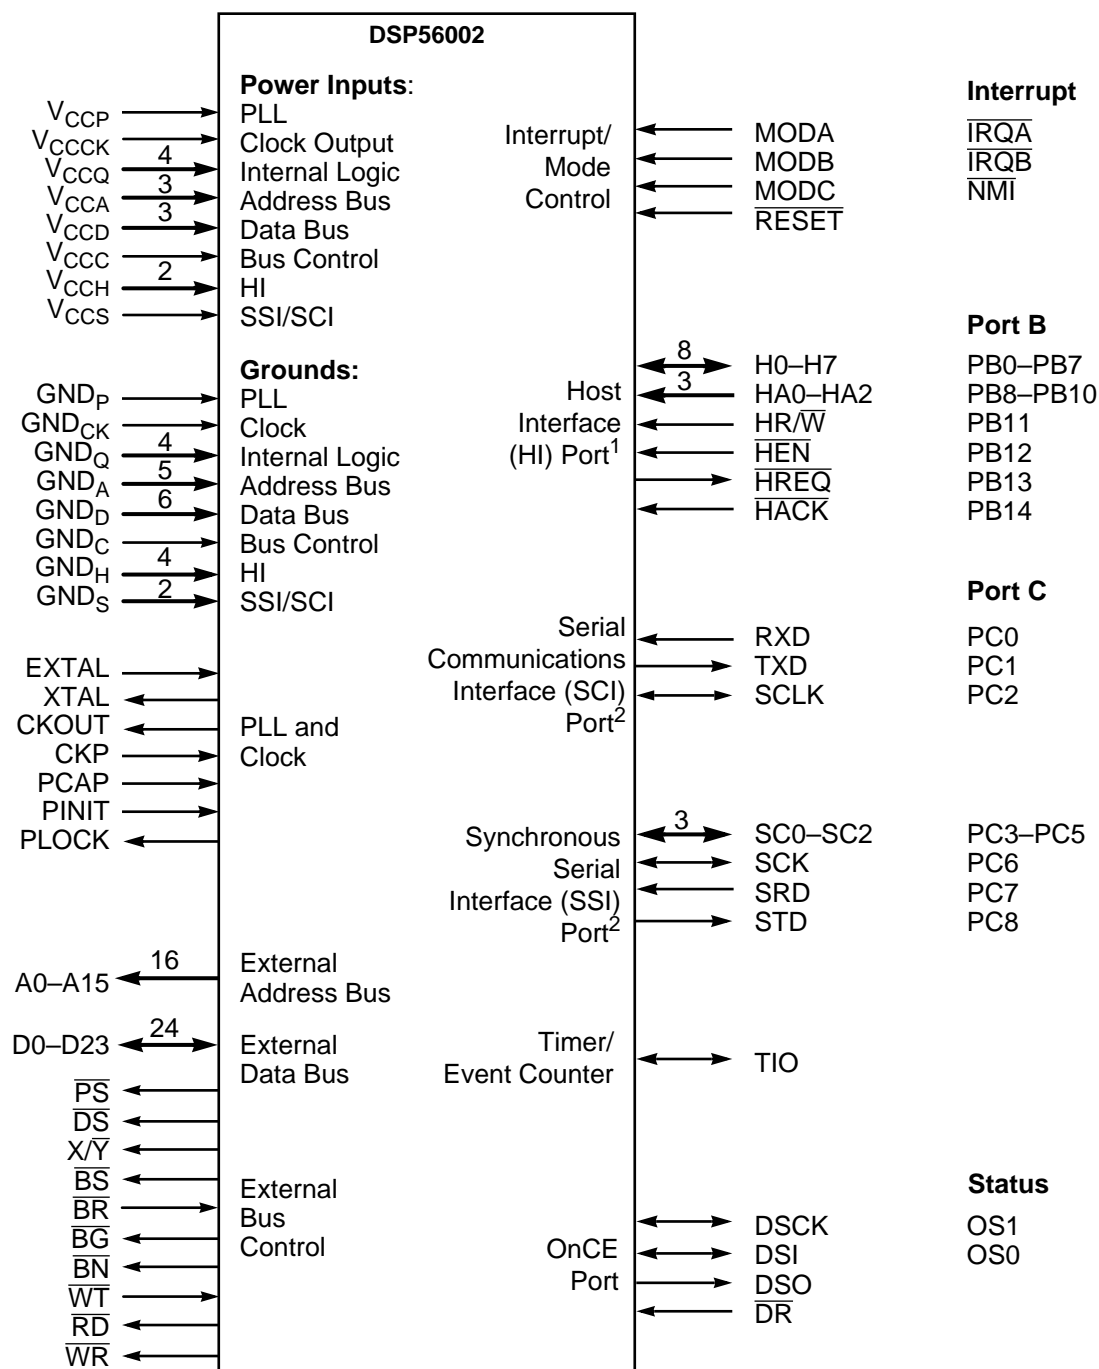

INTRODUCTION

DSP56002 signals are organized into twelve functional groups, as summarized in **Table 1-1**.

Table 1-1 Signal Functional Group Allocations

Functional Group		Number of Signals	Detailed Description
Power (V _{CCX})		16	Table 1-2
Ground (GND _X)		24	Table 1-3
PLL and Clock		7	Table 1-4
Address Bus	Port A ¹	16	Table 1-5
Data Bus		24	Table 1-6
Bus Control		10	Table 1-7
Interrupt and Mode Control		4	Table 1-8
Host Interface (HI) Port	Port B ²	15	Table 1-9
Serial Communications Interface (SCI) Port	Port C ³	3	Table 1-10
Synchronous Serial Interface (SSI) Port		6	Table 1-11
Timer/Event Counter or General Purpose Input/Output (GPIO)		1	Table 1-12
On-Chip Emulation (OnCE) Port		4	Table 1-13
Note: 1. Port A signals define the External Memory Interface port. 2. Port B signals are the HI signals multiplexed on the external pins with the GPIO signals. 3. Port C signals are the SCI and SSI signals multiplexed on the external pins with the GPIO signals.			

Figure 1-1 is a diagram of DSP56002 signals by functional group.

- Note:
1. The Host Interface port signals are multiplexed with the Port B GPIO signals (PB0–PB15).
 2. The SCI and SSI signals are multiplexed with the Port C GPIO signals (PC0–PC8).
 3. Power and Ground lines are indicated for the 144-pin TQFP package.

AA1081G

Figure 1-1 Signals Identified by Functional Group

POWER

Table 1-2 Power

Power Names	Description
V_{CCP}	Analog PLL Circuit Power —This line is dedicated to the analog PLL circuits and must remain noise-free to ensure stable PLL frequency and performance. Ensure that the input voltage to this line is well-regulated and uses an extremely low impedance path to tie to the V_{CC} power rail. Use a 0.1 μ F capacitor and a 0.01 μ F capacitor located as close as possible to the chip package to connect between the V_{CCP} line and the GND_P line.
V_{CCCK}	Clock Output Power —This line supplies a quiet power source for the CKOUT output. Ensure that the input voltage to this line is well-regulated and uses an extremely low impedance path to tie to the V_{CC} power rail. Use a 0.1 μ F bypass capacitor located as close as possible to the chip package to connect between the V_{CCCK} line and the GND_{CK} line.
V_{CCQ} (4)	Oscillator Power —These lines supply a quiet power source to the oscillator circuits and the mode control and interrupt lines. Ensure that the input voltage to this line is well-regulated and uses an extremely low impedance path to tie to the V_{CC} power rail. Use a 0.1 μ F bypass capacitor located as close as possible to the chip package to connect between the V_{CCQ} lines and the GND_Q lines.
V_{CCA} (3)	Address Bus Power —These lines supply power to the address bus.
V_{CCD} (3)	Data Bus Power —These lines supply power to the data bus.
V_{CCC}	Bus Control Power —This line supplies power to the bus control logic.
V_{CCH} (2)	Host Interface Power —These lines supply power to the Host Interface logic.
V_{CCS}	Serial Interface Power —This line supplies power to the serial interface logic (SCI and SSI).

GROUND

Table 1-3 Ground

Ground Names	Description
GND _P	Analog PLL Circuit Ground —This line supplies a dedicated quiet ground connection for the analog PLL circuits and must remain relatively noise-free to ensure stable PLL frequency and performance. Ensure that this line connects through an extremely low impedance path to ground. Use a 0.1 μ F capacitor and a 0.01 μ F capacitor located as close as possible to the chip package to connect between the V _{CCP} line and the GND _P line.
GND _{CK}	Clock Output Ground —This line supplies a quiet ground connection for the CKOUT output. Ensure that this line connects through an extremely low impedance path to ground. Use a 0.1 μ F bypass capacitor located as close as possible to the chip package to connect between the V _{CCCK} line and the GND _{CK} line.
GND _Q (4)	Oscillator Ground —These lines supply a quiet ground connection for the oscillator circuits and the mode control and interrupt lines. Ensure that this line connects through an extremely low impedance path to ground. Use a 0.1 μ F bypass capacitor located as close as possible to the chip package to connect between the V _{CCQ} line and the GND _Q line.
GND _A (5)	Address Bus Ground —These lines connect system ground to the address bus.
GND _D (6)	Data Bus Ground —These lines connect system ground to the data bus.
GND _C	Bus Control Ground —This line connects ground to the bus control logic.
GND _H (4)	Host Interface Ground —These lines supply ground connections for the Host Interface logic.
GND _S (2)	Serial Interface Ground —These lines supply ground connections for the serial interface logic (SCI and SSI).

PLL AND CLOCK

Table 1-4 PLL and Clock Signals

Signal Name	Signal Type	State during Reset	Signal Description
EXTAL	Input	Input	External Clock/Crystal Input —This input connects the internal oscillator input to an external crystal or to an external oscillator.
XTAL	Output	Chip-driven	Crystal Output —This output connects the internal crystal oscillator output to an external crystal. If an external oscillator is used, XTAL should be left unconnected.
CKOUT	Output	Chip-driven	<p>PLL Output Clock—When the PLL is enabled and locked, this signal provides a 50% duty cycle output clock signal synchronized to the internal processor clock.</p> <p>When the PLL is enabled and the Multiplication Factor is less than or equal to 4, then CKOUT is synchronized to EXTAL.</p> <p>When the PLL is disabled, the output clock at CKOUT is derived from, and has the same frequency and duty cycle as, EXTAL.</p> <p>Note: For information about using the PLL Multiplication Factor, see the <i>DSP56002 User's Manual</i>.</p>
CKP	Input	Input	PLL Output Clock Polarity Control —The value of this signal at reset defines the polarity of the CKOUT output relative to EXTAL. If CKP is pulled low by connecting through a resistor to ground, CKOUT and EXTAL have the same polarity. Pulling CKP high by connecting it through a resistor to V_{CC} causes CKOUT and EXTAL to be inverse polarities. The polarity of CKOUT is latched at the end of reset; therefore, any changes to CKP after deassertion of \overline{RESET} do not affect CKOUT polarity.
PCAP	Input/Output	Indeterminate	PLL Capacitor —This signal is used to connect the required external filter capacitor to the PLL filter. Connect one end of the capacitor to PCAP and the other to V_{CCP} . The value of the capacitor is specified in Section 2 of this data sheet.

Table 1-4 PLL and Clock Signals (Continued)

Signal Name	Signal Type	State during Reset	Signal Description
PINIT	Input	Input	<p>PLL Initialization Source—The value of this signal at reset defines the value written into the PLL Enable (PEN) bit in the PLL control register.</p> <p>If PINIT is pulled high during reset, the PEN bit is written as a 1, enabling the PLL and causing the DSP internal clocks to be derived from the PLL VCO.</p> <p>If PINIT is pulled low during reset, the PEN bit is written as a 0, disabling the PLL and causing DSP internal clocks to be derived from the clock connected to EXTAL.</p> <p>PEN is written only at the deassertion of $\overline{\text{RESET}}$ and; therefore, the value of PINIT is ignored after that time.</p>
PLOCK	Output	Indeterminate	<p>Phase and Frequency Lock—This output is generated by an internal Phase Detector circuit. This circuit drives the output high when:</p> <ul style="list-style-type: none"> the PLL is disabled (the output clock is EXTAL and is therefore in phase with itself), or the PLL is enabled and is locked onto the proper phase (based on the CKP value) and frequency of EXTAL. <p>The circuit drives the output low (deasserted) whenever the PLL is enabled, but has not locked onto the proper phase and frequency.</p> <p>Note: PLOCK is a reliable indicator of the PLL lock state only after the chip has exited the Reset state. During hardware reset, the PLOCK state is determined by PINIT and the current PLL lock condition.</p>

ADDRESS BUS

Table 1-5 Address Bus Signals

Signal Names	Signal Type	State during Reset	Signal Description
A0–A15	Output	Tri-stated	Address Bus —These signals specify the address for external program and data memory accesses. If there is no external bus activity, A0–A15 remain at their previous values to reduce power consumption. A0–A15 are tri-stated when the bus grant signal is asserted.

DATA BUS

Table 1-6 Data Bus Signals

Signal Names	Signal Type	State during Reset	Signal Description
D0–D23	Input/Output	Tri-stated	Data Bus —These signals provide the bidirectional data bus for external program and data memory accesses. D0–D23 are tri-stated when the \overline{BG} or \overline{RESET} signal is asserted.

BUS CONTROL

Table 1-7 Bus Control Signals

Signal Name	Signal Type	State during Reset	Signal Description
\overline{PS}	Output	Tri-stated	Program Memory Select — \overline{PS} is asserted low for external program memory access. \overline{PS} is tri-stated when the \overline{BG} or \overline{RESET} signal is asserted.
\overline{DS}	Output	Tri-stated	Data Memory Select — \overline{DS} is asserted low for external data memory access. \overline{DS} is tri-stated when the \overline{BG} or \overline{RESET} signal is asserted.
X/\overline{Y}	Output	Tri-stated	X/Y External Memory Select —This output is driven low during external Y data memory accesses. It is also driven low during external exception vector fetches when operating in the Development mode. X/\overline{Y} is tri-stated when the \overline{BG} or \overline{RESET} signal is asserted.
\overline{BS}	Output	Pulled high	Bus Select — \overline{BS} is asserted when the DSP accesses the external bus, and it acts as an early indication of imminent external bus access by the DSP56002. It may also be used with the bus wait input \overline{WT} to generate wait states. \overline{BS} is pulled high when the \overline{BG} or \overline{RESET} signal is asserted.
\overline{BR}	Input	Input	<p>Bus Request—When the Bus Request input (\overline{BR}) is asserted, it allows an external device, such as another processor or DMA controller, to become the master of the external address and data buses. While the bus is released, the DSP may continue internal operations using internal memory spaces. When \overline{BR} is deasserted, the DSP56002 is the bus master. When \overline{BR} is asserted, the DSP56002 will release Port A, including A0–A15, D0–D23, and the bus control signals (\overline{PS}, \overline{DS}, X/\overline{Y}, \overline{RD}, \overline{WR}, and \overline{BS}) by placing them in the high-impedance state after execution of the current instruction has been completed.</p> <p>Note: To prevent erroneous operation, pull up the \overline{BR} signal when it is not in use.</p>
\overline{BG}	Output	Pulled high	Bus Grant —When this output is asserted, it grants an external device's request for access to the external bus. This output is deasserted during hardware reset.

Table 1-7 Bus Control Signals (Continued)

Signal Name	Signal Type	State during Reset	Signal Description
$\overline{\text{BN}}$	Output	Pulled low	<p>Bus Not Required—The $\overline{\text{BN}}$ signal is asserted whenever the chip requires mastership of the external bus. During instruction cycles where the external bus is not required, $\overline{\text{BN}}$ is deasserted. If the $\overline{\text{BN}}$ signal is asserted when the DSP is not the bus master, processing has stopped and the chip is waiting to acquire bus ownership. An external arbiter may use this signal to help determine when to return bus ownership to the DSP.</p> <p>Note: The $\overline{\text{BN}}$ signal cannot be used as an early indication of imminent external bus access because it is valid later than the other bus control signals $\overline{\text{BS}}$ and $\overline{\text{WT}}$.</p>
$\overline{\text{WT}}$	Input	Input	<p>Bus Wait—An external device may insert wait states by asserting $\overline{\text{WT}}$ during external bus cycles.</p> <p>Note: To prevent erroneous operation, pull up the $\overline{\text{WT}}$ signal when it is not in use.</p>
$\overline{\text{WR}}$	Output	Tri-stated	<p>Write Enable—$\overline{\text{WR}}$ is asserted low during external memory write cycles. $\overline{\text{WR}}$ is tri-stated when the $\overline{\text{BG}}$ or $\overline{\text{RESET}}$ signal is asserted.</p>
$\overline{\text{RD}}$	Output	Tri-stated	<p>Read Enable—$\overline{\text{RD}}$ is asserted low during external memory read cycles. $\overline{\text{RD}}$ is tri-stated when the $\overline{\text{BG}}$ or $\overline{\text{RESET}}$ signal is asserted.</p>

INTERRUPT AND MODE CONTROL

Table 1-8 Interrupt and Mode Control Signals

Signal Name	Signal Type	State during Reset	Signal Description
MODA/ $\overline{\text{IRQA}}$	Input	Input	<p>Mode Select A/External Interrupt Request A—This input has two functions:</p> <ol style="list-style-type: none"> 1. to select the initial chip operating mode, and 2. after synchronization, to allow an external device to request a DSP interrupt. <p>MODA is read and internally latched in the DSP when the processor exits the Reset state. MODA, MODB, and MODC select the initial chip operating mode. Several clock cycles (depending on PLL stabilization time) after leaving the Reset state, the MODA signal changes to external interrupt request $\overline{\text{IRQA}}$. The chip operating mode can be changed by software after reset. The $\overline{\text{IRQA}}$ input is a synchronized external interrupt request that indicates that an external device is requesting service. It may be programmed to be level-sensitive or negative-edge-sensitive. If level-sensitive triggering is selected, an external pull up resistor is required for wired-OR operation. If the processor is in the Stop state and $\overline{\text{IRQA}}$ is asserted, the processor will exit the Stop state.</p>
MODB/ $\overline{\text{IRQB}}$	Input	Input	<p>Mode Select B/External Interrupt Request B—This input has two functions:</p> <ol style="list-style-type: none"> 1. to select the initial chip operating mode, and 2. after internal synchronization, to allow an external device to request a DSP interrupt. <p>MODB is read and internally latched in the DSP when the processor exits the Reset state. MODA, MODB, and MODC select the initial chip operating mode. Several clock cycles (depending on PLL stabilization time) after leaving the Reset state, the MODB signal changes to external interrupt request $\overline{\text{IRQB}}$. After reset, the chip operating mode can be changed by software. The $\overline{\text{IRQB}}$ input is an external interrupt request that indicates that an external device is requesting service. It may be programmed to be level-sensitive or negative-edge-triggered. If level-sensitive triggering is selected, an external pull up resistor is required for wired-OR operation.</p>

Table 1-8 Interrupt and Mode Control Signals (Continued)

Signal Name	Signal Type	State during Reset	Signal Description
MODC/ $\overline{\text{NMI}}$	Input	Input	<p>Mode Select C/Non-maskable Interrupt Request—This input has two functions:</p> <ol style="list-style-type: none"> 1. to select the initial chip operating mode, and 2. after internal synchronization, to allow an external device to request a non-maskable DSP interrupt. <p>MODC is read and internally latched in the DSP when the processor exits the Reset state. MODA, MODB, and MODC select the initial chip operating mode. Several clock cycles (depending on PLL stabilization time) after leaving the Reset state, the MODC signal changes to the nonmaskable external interrupt request $\overline{\text{NMI}}$. After reset, the chip operating mode can be changed by software. The $\overline{\text{NMI}}$ input is an external interrupt request that indicates that an external device is requesting service. It may be programmed to be level-sensitive or negative-edge-triggered. If level-sensitive triggering is selected, an external pull up resistor is required for wired-OR operation.</p>
$\overline{\text{RESET}}$	Input	Input	<p>Reset—This input is a direct hardware reset on the processor. When $\overline{\text{RESET}}$ is asserted low, the DSP is initialized and placed in the Reset state. A Schmitt trigger input is used for noise immunity. When the $\overline{\text{RESET}}$ signal is deasserted, the initial chip operating mode is latched from the MODA, MODB, and MODC signals. The internal reset signal is deasserted synchronous with the internal clocks. In addition, the PINIT pin is sampled and written into the PEN bit of the PLL Control Register and the CKP pin is sampled to determine the polarity of the CKOUT signal.</p>

HOST INTERFACE (HI) PORT

Table 1-9 HI Signals

Signal Name	Signal Type	State during Reset	Signal Description
H0–H7 PB0–PB7	Input or Output	Tri-stated	<p>Host Data Bus (H0–H7)—This data bus transfers data between the host processor and the DSP56002.</p> <p>When configured as a Host Interface port, the H0–H7 signals are tri-stated as long as $\overline{\text{HEN}}$ is deasserted. The signals are inputs unless $\text{HR}/\overline{\text{W}}$ is high and $\overline{\text{HEN}}$ is asserted, in which case H0–H7 become outputs, allowing the host processor to read the DSP56002 data. H0–H7 become outputs when $\overline{\text{HACK}}$ is asserted during $\overline{\text{HREQ}}$ assertion.</p> <p>Port B GPIO 0–7 (PB0–PB7)—These signals are General Purpose I/O signals (PB0–PB7) when the Host Interface is not selected.</p> <p>After reset, the default state for these signals is GPIO input.</p>
HA0–HA2 PB8–PB10	Input Input or Output	Tri-stated	<p>Host Address 0—Host Address 2 (HA0–HA2)—These inputs provide the address selection for each Host Interface register.</p> <p>Port B GPIO 8–10 (PB8–PB10)—These signals are General Purpose I/O signals (PB8–PB10) when the Host Interface is not selected.</p> <p>After reset, the default state for these signals is GPIO input.</p>
$\text{HR}/\overline{\text{W}}$ PB11	Input Input or Output	Tri-stated	<p>Host Read/Write—This input selects the direction of data transfer for each host processor access. If $\text{HR}/\overline{\text{W}}$ is high and $\overline{\text{HEN}}$ is asserted, H0–H7 are outputs and DSP data is transferred to the host processor. If $\text{HR}/\overline{\text{W}}$ is low and $\overline{\text{HEN}}$ is asserted, H0–H7 are inputs and host data is transferred to the DSP. $\text{HR}/\overline{\text{W}}$ must be stable when $\overline{\text{HEN}}$ is asserted.</p> <p>Port B GPIO 11 (PB11)—This signal is a General Purpose I/O signal called PB11 when the Host Interface is not being used.</p> <p>After reset, the default state for this signal is GPIO input.</p>

Table 1-9 HI Signals (Continued)

Signal Name	Signal Type	State during Reset	Signal Description
$\overline{\text{HEN}}$	Input	Tri-stated	Host Enable —This input enables a data transfer on the host data bus. When $\overline{\text{HEN}}$ is asserted and $\text{HR}/\overline{\text{W}}$ is high, H0–H7 become outputs and the host processor may read DSP56002/L002 data. When $\overline{\text{HEN}}$ is asserted and $\text{HR}/\overline{\text{W}}$ is low, H0–H7 become inputs. Host data is latched inside the DSP on the rising edge of $\overline{\text{HEN}}$. Normally, a chip select signal derived from host address decoding and an enable strobe are used to generate $\overline{\text{HEN}}$.
PB12	Input or Output		Port B GPIO 12 (PB12) —This signal is a General Purpose I/O signal called PB12 when the Host Interface is not being used. After reset, the default state for this signal is GPIO input.
$\overline{\text{HREQ}}$	Open drain Output	Tri-stated	Host Request —This signal is used by the Host Interface to request service from the host processor, DMA controller, or a simple external controller. Note: $\overline{\text{HREQ}}$ should always be pulled high when it is not in use.
PB13	Input or Output		Port B GPIO 13 (PB13) —This signal is a General Purpose (not open-drain) I/O signal (PB13) when the Host Interface is not selected. After reset, the default state for this signal is GPIO input.
$\overline{\text{HACK}}$	Input	Tri-stated	Host Acknowledge —This input has two functions. It provides a host acknowledge handshake signal for DMA transfers and it receives a host interrupt acknowledge compatible with MC68000 family processors. Note: $\overline{\text{HACK}}$ should always be pulled high when it is not in use.
PB14	Input or Output		Port B GPIO 14 (PB14) —This signal is a General Purpose I/O signal (PB14) when the Host Interface is not selected. After reset, the default state for this signal is GPIO input.

SERIAL COMMUNICATIONS INTERFACE PORT

Table 1-10 Serial Communications Interface (SCI+) Signals

Signal Name	Signal Type	State during Reset	Signal Description
RXD	Input	Tri-stated	Receive Data (RXD) —This input receives byte-oriented data and transfers the data to the SCI receive shift register. Input data can be sampled on either the positive edge or on the negative edge of the receive clock, depending on how the SCI control register is programmed.
PC0	Input or Output		Port C GPIO 0 (PC0) —This signal is a GPIO signal called PC0 when the SCI RXD function is not being used. After reset, the default state is GPIO input.
TXD	Output	Tri-stated	Transmit Data (TXD) —This output transmits serial data from the SCI transmit shift register. In the default configuration, the data changes on the positive clock edge and is valid on the negative clock edge. The user can reverse this clock polarity by programming the SCI control register appropriately.
PC1	Input or Output		Port C GPIO 1 (PC1) —This signal is a GPIO signal called PC1 when the SCI TXD function is not being used. After reset, the default state is GPIO input.
SCLK	Input or Output	Tri-stated	SCI Clock (SCLK) —This signal provides an input or output clock from which the receive or transmit baud rate is derived in the Asynchronous mode, and from which data is transferred in the Synchronous mode. The direction and function of the signal is defined by the RCM bit in the SCI+ Clock Control Register (SCCR).
PC2			Port C GPIO 2 (PC2) —This signal is a GPIO signal called PC2 when the SCI SCLK function is not being used. After reset, the default state is GPIO input.

SYNCHRONOUS SERIAL INTERFACE PORT

Table 1-11 Synchronous Serial Interface (SSI) Signals

Signal Name	Signal Type	State during Reset	Signal Description
SC0 PC3	Input or Output	Tri-stated	<p>Serial Clock 0 (SC0)—This signal's function is determined by whether the SCLK is in Synchronous or Asynchronous mode.</p> <ul style="list-style-type: none"> In Synchronous mode, this signal is used as a serial I/O flag. In Asynchronous mode, this signal receives clock I/O. <p>Port C GPIO 3 (PC3)—This signal is a GPIO signal called PC3 when the SSI SC0 function is not being used.</p> <p>After reset, the default state is GPIO input.</p>
SC1 PC4	Input or Output	Tri-stated	<p>Serial Clock 1 (SC1)—The SSI uses this bidirectional signal to control flag or frame synchronization. This signal's function is determined by whether the SCLK is in Synchronous or Asynchronous mode.</p> <ul style="list-style-type: none"> In Asynchronous mode, this signal is frame sync I/O. For Synchronous mode with continuous clock, this signal is a serial I/O flag and operates like the SC0. <p>SC0 and SC1 are independent serial I/O flags but may be used together for multiple serial device selection.</p> <p>Port C GPIO 4 (PC4)—This signal is a GPIO signal called PC4 when the SSI SC1 function is not being used.</p> <p>After reset, the default state is GPIO input.</p>
SC2 PC5	Input or Output	Tri-stated	<p>Serial Clock 2 (SC2)—The SSI uses this bidirectional signal to control frame synchronization only. As with SC0 and SC1, its function is defined by the SSI operating mode.</p> <p>Port C GPIO 5 (PC5)—This signal is a GPIO signal called PC5 when the SSI SC1 function is not being used.</p> <p>After reset, the default state is GPIO input.</p>

Table 1-11 Synchronous Serial Interface (SSI) Signals (Continued)

Signal Name	Signal Type	State during Reset	Signal Description
SCK PC6	Input or Output	Tri-stated	<p>SSI Serial Receive Clock—This bidirectional signal provides the serial bit rate clock for the SSI when only one clock is being used.</p> <p>Port C GPIO 6 (PC6)—This signal is a GPIO signal called PC6 when the SSI function is not being used.</p> <p>After reset, the default state is GPIO input.</p>
SRD PC7	Input Input or Output	Tri-stated	<p>SSI Receive Data—This input signal receives serial data and transfers the data to the SSI Receive Shift Register.</p> <p>Port C GPIO 7 (PC7)—This signal is a GPIO signal called PC7 when the SSI SRD function is not being used.</p> <p>After reset, the default state is GPIO input.</p>
STD PC8	Output Input or Output	Tri-stated	<p>SSI Transmit Data (STD)—This output signal transmits serial data from the SSI Transmitter Shift Register.</p> <p>Port C GPIO 8 (PC8)—This signal is a GPIO signal called PC8 when the SSI STD function is not being used.</p> <p>After reset, the default state is GPIO input.</p>

TIMERS

Table 1-12 Timer Signals

Signal Name	Signal Type	State during Reset	Signal Description
TIO	Input or Output	Tri-stated	<p>Timer Input/Output—The TIO signal provides an interface to the timer/event counter module. When the module functions as an external event counter or is used to measure external pulse width/signal period, the TIO is an input. When the module functions as a timer, the TIO is an output, and the signal on the TIO signal is the timer pulse.</p> <p>When not used by the timer module, the TIO can be programmed through the Timer Control/Status Register (TCSR) to be a General Purpose I/O signal.</p> <p>TIO is effectively disconnected upon leaving reset.</p>

On-CHIP EMULATION PORT

Table 1-13 On-Chip Emulation (OnCE) Signals

Signal Name	Signal Type	State during Reset	Signal Description
DSI/OS0	Input or Output	Low Output	<p>Debug Serial Input/Chip Status 0—Serial data or commands are provided to the OnCE controller through the DSI/OS0 signal when it is an input. The data received on the DSI signal will be recognized only when the DSP has entered the Debug mode of operation. Data is latched on the falling edge of the DSCK serial clock. Data is always shifted into the OnCE serial port Most Significant Bit (MSB) first. When the DSI/OS0 signal is an output, it works in conjunction with the OS1 signal to provide chip status information. The DSI/OS0 signal is an output when the processor is not in Debug mode. When switching from output to input, the signal is tri-stated.</p> <p>Note: Connect an external pull-down resistor to this signal.</p>
DSCK/OS1	Input or Output	Low Output	<p>Debug Serial Clock/Chip Status 1—The DSCK/OS1 signal supplies the serial clock to the OnCE when it is an input. The serial clock provides pulses required to shift data into and out of the OnCE serial port. (Data is clocked into the OnCE on the falling edge and is clocked out of the OnCE serial port on the rising edge.) The debug serial clock frequency must be no greater than $\frac{1}{8}$ of the processor clock frequency. When switching from input to output, the signal is tri-stated.</p> <p>When it is an output, this signal works with the OS0 signal to provide information about the chip status. The DSCK/OS1 signal is an output when the chip is not in Debug mode.</p> <p>Note: Connect an external pull-down resistor to this signal.</p>

Table 1-13 On-Chip Emulation (OnCE) Signals (Continued)

Signal Name	Signal Type	State during Reset	Signal Description
DSO	Output	Pulled high	<p>Debug Serial Output—Data contained in one of the OnCE controller registers is provided through the DSO output signal, as specified by the last command received from the external command controller. Data is always shifted out the OnCE serial port Most Significant Bit (MSB) first. Data is clocked out of the OnCE serial port on the rising edge of DSCK.</p> <p>The DSO signal also provides acknowledge pulses to the external command controller. When the chip enters the Debug mode, the DSO signal will be pulsed low to indicate (acknowledge) that the OnCE is waiting for commands. After the OnCE receives a read command, the DSO signal will be pulsed low to indicate that the requested data is available and the OnCE serial port is ready to receive clocks in order to deliver the data. After the OnCE receives a write command, the DSO signal will be pulsed low to indicate that the OnCE serial port is ready to receive the data to be written; after the data is written, another acknowledge pulse will be provided.</p> <p>Note: Connect an external pull-up resistor to this signal.</p>
\overline{DR}	Input	Input	<p>Debug Request—The debug request input (\overline{DR}) allows the user to enter the Debug mode of operation from the external command controller. When \overline{DR} is asserted, it causes the DSP to finish the current instruction being executed, save the instruction pipeline information, enter the Debug mode, and wait for commands to be entered from the DSI line. While in Debug mode, the \overline{DR} signal lets the user reset the OnCE controller by asserting it and deasserting it after receiving acknowledge. It may be necessary to reset the OnCE controller in cases where synchronization between the OnCE controller and external circuitry is lost. \overline{DR} must be deasserted after the OnCE responds with an acknowledge on the DSO signal and before sending the first OnCE command. Asserting \overline{DR} will cause the chip to exit the Stop or Wait state. Having \overline{DR} asserted during the deassertion of \overline{RESET} will cause the DSP to enter Debug mode.</p> <p>Note: Connect an external pull-up resistor to this signal.</p>

SECTION 2

SPECIFICATIONS

GENERAL CHARACTERISTICS

The DSP56002 is fabricated in high-density HCMOS with TTL compatible inputs and outputs.

MAXIMUM RATINGS

CAUTION

This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, normal precautions should be taken to avoid exceeding maximum voltage ratings. Reliability is enhanced if unused inputs are tied to an appropriate logic voltage level (e.g., either GND or V_{CC}).

Note: In the calculation of timing requirements, adding a maximum value of one specification to a minimum value of another specification does not yield a reasonable sum. A maximum specification is calculated using a worst case variation of process parameter values in one direction. The minimum specification is calculated using the worst case for the same parameters in the opposite direction. Therefore, a “maximum” value for a specification will never occur in the same device that has a “minimum” value for another specification; adding a maximum to a minimum represents a condition that can never exist.

Specifications

Thermal characteristics

Table 2-1 Absolute Maximum Ratings (GND = 0 V)

Rating	Symbol	Value	Unit
Supply Voltage	V_{CC}	-0.3 to +7.0	V
All Input Voltages	V_{IN}	(GND - 0.5) to ($V_{CC} + 0.5$)	V
Current Drain per Pin excluding V_{CC} and GND	I	10	mA
Operating Temperature Range	T_J	-40 to +105	°C
Storage Temperature	T_{stg}	-55 to +150	°C

THERMAL CHARACTERISTICS

Table 2-2 Thermal Characteristics

Characteristic	Symbol	PQFP Value ³	TQFP Value ³	TQFP Value ⁴	PGA Value ³	Unit
Junction-to-ambient thermal resistance ¹	$R_{\theta JA}$ or θ_{JA}	50	48	40.6	22	°C/W
Junction-to-case thermal resistance ²	$R_{\theta JC}$ or θ_{JC}	12.4	10.8	—	6.5	°C/W
Thermal characterization parameter	Ψ_{JT}	4.0	0.16	—	N/A	°C/W

- Notes:
1. Junction-to-ambient thermal resistance is based on measurements on a horizontal-single-sided Printed Circuit Board per SEMI G38-87 in natural convection. (SEMI is Semiconductor Equipment and Materials International, 805 East Middlefield Rd., Mountain View, CA 94043, (415) 964-5111) Measurements were made with the parts installed on thermal test boards meeting the specification EIA/JEDEC SI-3.
 2. Junction-to-case thermal resistance is based on measurements using a cold plate per SEMI G30-88, with the exception that the cold plate temperature is used for the case temperature.
 3. These are measured values. See note 1 for test board conditions.
 4. These are measured values; testing is not complete. Values were measured on a non-standard four-layer thermal test board (two internal planes) at one watt in a horizontal configuration.

DC ELECTRICAL CHARACTERISTICS

Table 2-3 DC Electrical Characteristics

Characteristics	Symbol	Min	Typ	Max	Units
Supply Voltage	V_{CC}	4.5	5.0	5.5	V
Input High Voltage					
• EXTAL	V_{IHC}	4.0	—	V_{CC}	V
• RESET	V_{IHR}	2.5	—	V_{CC}	V
• MODA, MODB, MODC	V_{IHM}	3.5	—	V_{CC}	V
• All other inputs	V_{IH}	2.0	—	V_{CC}	V
Input Low Voltage					
• EXTAL	V_{ILC}	-0.5	—	0.6	V
• MODA, MODB, MODC	V_{ILM}	-0.5	—	2.0	V
• All other inputs	V_{IL}	-0.5	—	0.8	V
Input Leakage Current EXTAL, RESET, MODA/ \overline{IRQA} , MODB/ \overline{IRQB} , MODC/ \overline{NMI} , DR, BR, WT, CKP, PINIT, MCBG, MCBCLR, MCCLK, D20IN	I_{IN}	-1	—	1	μA
Tri-state (Off-state) Input Current (@ 2.4 V/0.4 V)	I_{TSI}	-10	—	10	μA
Output High Voltage ($I_{OH} = -0.4$ mA)	V_{OH}	2.4	—	—	V
Output Low Voltage ($I_{OL} = 3.0$ mA) \overline{HREQ} $I_{OL} = 6.7$ mA, TXD $I_{OL} = 6.7$ mA	V_{OL}	—	—	0.4	V
Internal Supply Current at 40 MHz ¹					
• In Wait mode ²	I_{CCI}	—	90	105	mA
• In Stop mode ²	I_{CCW}	—	12	20	mA
	I_{CCS}	—	2	95	μA
Internal Supply Current at 66 MHz ¹					
• In Wait mode ²	I_{CCI}	—	95	130	mA
• In Stop mode ²	I_{CCW}	—	15	25	mA
	I_{CCS}	—	2	95	μA
Internal Supply Current at 80 MHz ¹					
• In Wait mode ²	I_{CCI}	—	115	160	mA
• In Stop mode ²	I_{CCW}	—	18	30	mA
	I_{CCS}	—	2	95	μA
PLL Supply Current ³					
• 40 MHz		—	1.0	1.5	mA
• 66 MHz		—	1.1	1.5	mA
• 80 MHz		—	1.2	1.8	mA
CKOUT Supply Current ⁴					
• 40 MHz		—	14	20	mA
• 66 MHz		—	28	35	mA
• 80 MHz		—	34	42	mA
Input Capacitance ⁵	C_{IN}	—	10	—	pF
Notes: 1. Section 4 Design Considerations describes how to calculate the external supply current.					
2. In order to obtain these results all inputs must be terminated (i.e., not allowed to float).					
3. Values are given for PLL enabled.					
4. Values are given for CKOUT enabled.					
5. Periodically sampled and not 100% tested					

AC ELECTRICAL CHARACTERISTICS

The timing waveforms in the AC Electrical Characteristics are tested with a V_{IL} maximum of 0.5 V and a V_{IH} minimum of 2.4 V for all pins, except EXTAL, $\overline{\text{RESET}}$, MODA, MODB, and MODC. These pins are tested using the input levels set forth in the DC Electrical Characteristics. AC timing specifications that are referenced to a device input signal are measured in production with respect to the 50% point of the respective input signal's transition. DSP56002 output levels are measured with the production test machine V_{OL} and V_{OH} reference levels set at 0.8 V and 2.0 V, respectively.

Note: The midpoint is $V_{IL} + (V_{IH} - V_{IL})/2$.

AA0179

Figure 2-1 Signal Measurement Reference

INTERNAL CLOCKS

For each occurrence of T_H , T_L , T_C or I_{CYC} , substitute with the numbers in **Table 2-4**.
DF and MF are PLL division and multiplication factors set in registers.

Table 2-4 Internal Clocks

Characteristics	Symbol	Expression
Internal Operation Frequency	f	
Internal Clock High Period • With PLL disabled • With PLL enabled and $MF \leq 4$ • With PLL enabled and $MF > 4$	T_H	ET_H (Min) $0.48 \times T_C$ (Max) $0.52 \times T_C$ (Min) $0.467 \times T_C$ (Max) $0.533 \times T_C$
Internal Clock Low Period • With PLL disabled • With PLL enabled and $MF \leq 4$ • With PLL enabled and $MF > 4$	T_L	ET_L (Min) $0.48 \times T_C$ (Max) $0.52 \times T_C$ (Min) $0.467 \times T_C$ (Max) $0.533 \times T_C$
Internal Clock Cycle Time	T_C	$ET_C \times DF/MF$
Instruction Cycle Time	I_{CYC}	$2 \times T_C$

EXTERNAL CLOCK (EXTAL PIN)

The DSP56002 system clock may be derived from the on-chip crystal oscillator as shown in **Figure 2-2**, or it may be externally supplied. An externally supplied square wave voltage source should be connected to EXTAL, leaving XTAL physically unconnected to the board or socket. The rise and fall times of this external clock should be 4 ns maximum.

**Fundamental Frequency
Crystal Oscillator**

Suggested Component Values

$R = 680 \text{ k}\Omega \pm 10\%$

$C = 20 \text{ pf} \pm 20\%$

**3rd Overtone
Crystal Oscillator**

Suggested Component Values

$R1 = 470 \text{ k}\Omega \pm 10\%$

$R2 = 330 \text{ }\Omega \pm 10\%$

$C1 = 0.1 \text{ }\mu\text{f} \pm 20\%$

$C2 = 26 \text{ pf} \pm 20\%$

$C3 = 20 \text{ pf} \pm 10\%$

$L1 = 2.37 \text{ }\mu\text{H} \pm 10\%$

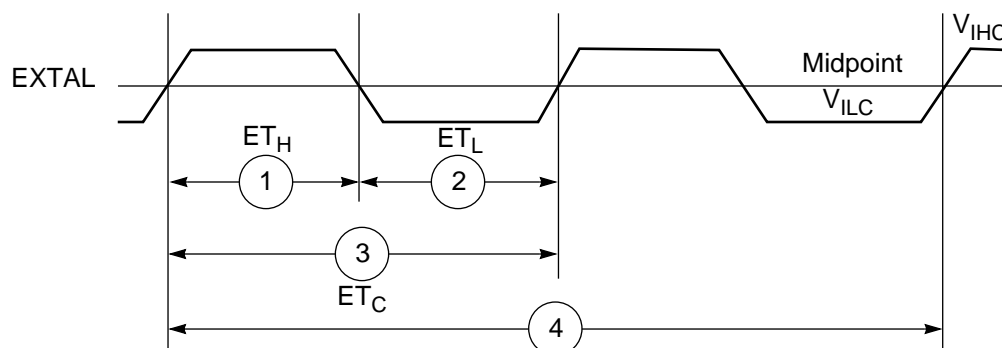

XTAL = 40 MHz, AT cut, 20 pf load,
50 Ω max series resistance

- Note:
1. The suggested crystal source is ICM, # 433163 - 4.00 (4 MHz fundamental, 20 pf load) or # 436163 - 30.00 (30 MHz fundamental, 20 pf load).
 2. To reduce system cost, a ceramic resonator may be used instead of the crystal. Suggested source: Murata-Erie #CST4.00MGW040 (4 MHz with built-in load capacitors)

- Note:
1. *3rd overtone crystal.
 2. The suggested crystal source is ICM, # 471163 - 40.00 (40 MHz 3rd overtone, 20 pf load).
 3. R2 limits crystal current.
 4. Reference Benjamin Parzen, The Design of Crystal and Other Harmonic Oscillators, John Wiley & Sons, 1983.

AA0211

Figure 2-2 Crystal Oscillator Circuits

NOTE: The midpoint is $V_{ILC} + 0.5 (V_{IHC} - V_{ILC})$.

AA0360

Note: External Clock Input High and External Clock Input Low are measured at 50% of the input transition.									

PHASE LOCK LOOP (PLL) CHARACTERISTICS

Table 2-6 Phase Lock Loop (PLL) Characteristics

Characteristics	Expression	Min	Max	Unit
VCO frequency when PLL enabled ^{1,2,3}	$MF \times E_f$	10	f	MHz
PLL external capacitor ⁴ (PCAP pin to V_{CCP})	$MF \times C_{pcap}$ @ $MF \leq 4$ @ $MF > 4$	$MF \times 340$ $MF \times 380$	$MF \times 480$ $MF \times 970$	pF pF
Notes: 1. The E in ET_H , ET_L , and ET_C means external. 2. MF is the PCTL Multiplication Factor bits (MF0–MF11). 3. The maximum VCO frequency is limited to the internal operation frequency. 4. Cpcap is the value of the PLL capacitor (connected between PCAP pin and V_{CCP}) for MF = 1. The recommended value for Cpcap is: 400 pF for $MF \leq 4$ and 540 pF for $MF > 4$.				

RESET, STOP, MODE SELECT, AND INTERRUPT TIMING

$C_L = 50 \text{ pF} + 2 \text{ TTL loads}$

WS = number of Wait States (0–15) programmed into the external bus access using BCR

1 Wait State = T_C

Notes: 1. A clock stabilization delay is required when using the on-chip crystal oscillator in two cases: <ul style="list-style-type: none">after power-on reset, andwhen recovering from Stop mode. During this stabilization period, T _C , T _H , and T _L will not be constant. Since this stabilization period varies, a delay of 75,000 × T _C is typically allowed to assure that the oscillator is stable before executing programs. 2. Circuit stabilization delay is required during reset when using an external clock in two cases: <ul style="list-style-type: none">after power-on reset, andwhen recovering from Stop mode. 3. When using fast interrupts and $\overline{\text{IRQA}}$ and $\overline{\text{IRQB}}$ are defined as level-sensitive, then timings 19 through 22 apply to prevent multiple interrupt service. To avoid these timing restrictions, the deasserted Edge-triggered mode is recommended when using fast interrupt. Long interrupts are recommended when using Level-sensitive mode.

SERIAL COMMUNICATION INTERFACE (SCI) TIMING

$C_L = 50 \text{ pF} + 2 \text{ TTL loads}$

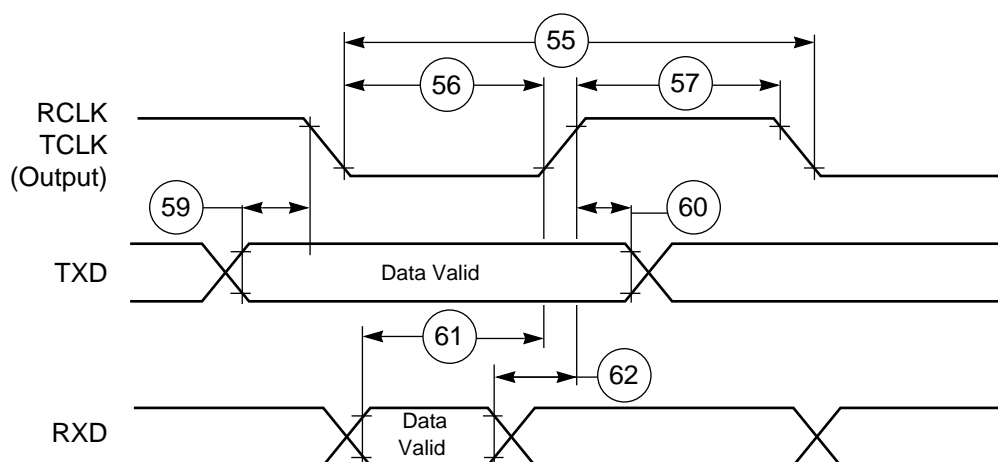

t_{SCC} = Synchronous Clock Cycle Time (For internal clock, t_{SCC} is determined by the SCI Clock Control Register and T_C .) The minimum t_{SCC} value is $8 \times T_C$.

Table 2-9 SCI Synchronous Mode Timing (All Frequencies)

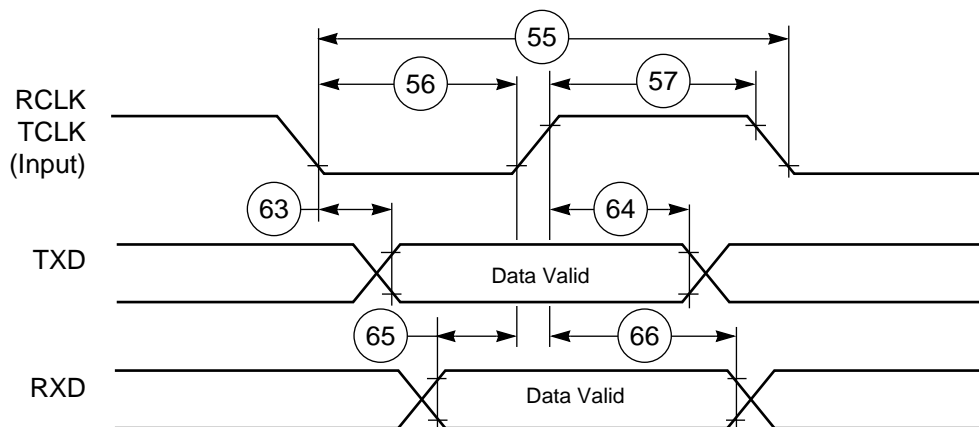

Num	Characteristics	Min	Max	Unit
55	Synchronous Clock Cycle— t_{SCC}	$8T_C$	—	ns
56	Clock Low Period	$t_{SCC}/2 - 10.5$	—	ns
57	Clock High Period	$t_{SCC}/2 - 10.5$	—	ns
58	< intentionally blank >	—	—	—
59	Output Data Setup to Clock Falling Edge (Internal Clock)	$t_{SCC}/4 + T_L - 26$	—	ns
60	Output Data Hold After Clock Rising Edge (Internal Clock)	$t_{SCC}/4 - T_L - 8$	—	ns
61	Input Data Setup Time Before Clock Rising Edge (Internal Clock)	$t_{SCC}/4 + T_L + 23$	—	ns
62	Input Data Not Valid Before Clock Rising Edge (Internal Clock)	—	$t_{SCC}/4 + T_L - 5.5$	ns
63	Clock Falling Edge to Output Data Valid (External Clock)	—	32.5	ns
64	Output Data Hold After Clock Rising Edge (External Clock)	$T_C + 3$	—	ns
65	Input Data Setup Time Before Clock Rising Edge (External Clock)	16	—	ns
66	Input Data Hold Time After Clock Rising Edge (External Clock)	21	—	ns

Table 2-10 SCI Asynchronous Mode Timing—1X Clock

Num	Characteristics	Min	Max	Unit
67	Asynchronous Clock Cycle— t_{ACC}	$64T_C$	—	ns
68	Clock Low Period	$t_{ACC}/2 - 11$	—	ns
69	Clock High Period	$t_{ACC}/2 - 11$	—	ns
70	< intentionally blank >	—	—	—
71	Output Data Setup to Clock Rising Edge (Internal Clock)	$t_{ACC}/2 - 51$	—	ns
72	Output Data Hold After Clock Rising Edge (Internal Clock)	$t_{ACC}/2 - 51$	—	ns

a) Internal Clock

b) External Clock

Figure 2-20 SSI Receiver Timing

EXTERNAL BUS ASYNCHRONOUS TIMING

$C_L = 50 \text{ pF} + 2 \text{ TTL loads}$

WS = Number of Wait States (0 to 15), as determined by BCR register

Capacitance Derating: The DSP56002 External Bus Timing Specifications are designed and tested at the maximum capacitive load of 50 pF, including stray capacitance. Typically, the drive capability of the External Bus pins (A0–A15, D0–D23, PS, DS, RD, WR, X/Y, EXTP) derates linearly at 1 ns per 12 pF of additional capacitance from 50 pF to 250 pF of loading. Port B and C pins (HI, SCI, SSI, and Timer) derate linearly at 1 ns per 5 pF of additional capacitance from 50 pF to 250 pF of loading. Active low lines should be “pulled up” in a manner consistent with the AC and DC specifications.

EXTERNAL BUS SYNCHRONOUS TIMING

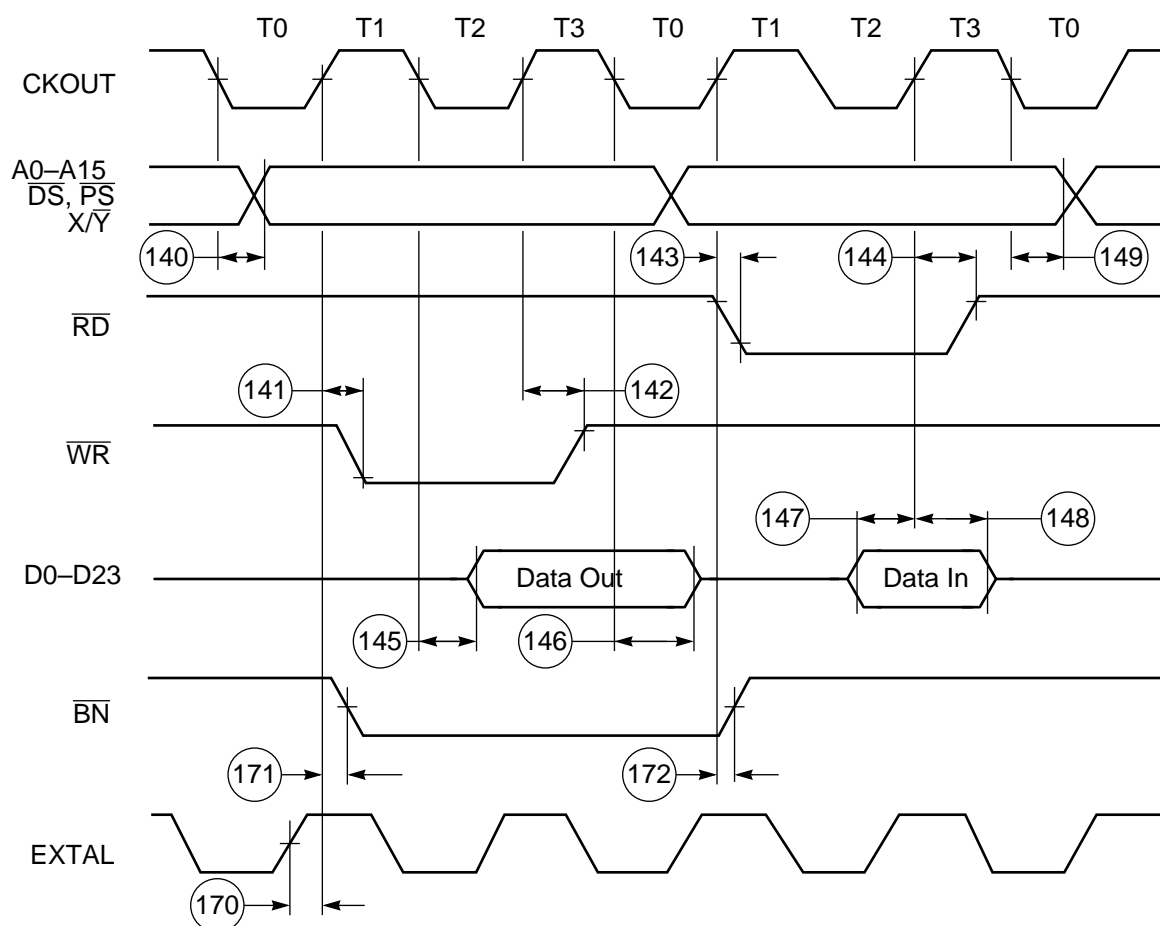

$C_L = 50 \text{ pF} + 2 \text{ TTL loads}$

Capacitance Derating: The DSP56002 external bus timing specifications are designed and tested at the maximum capacitive load of 50 pF, including stray capacitance. Typically, the drive capability of the external bus pins (A0–A15, D0–D23, $\overline{\text{PS}}$, $\overline{\text{DS}}$, $\overline{\text{RD}}$, $\overline{\text{WR}}$, X/Y) derates linearly at 1 ns per 12 pF of additional capacitance from 50 pF to 250 pF of loading. Port B and C pins (HI, SCI, SSI, and Timer) derate linearly at 1 ns per 5 pF of additional capacitance from 50 pF to 250 pF of loading. Active-low lines should be “pulled up” in a manner consistent with the ac and dc specifications.

Table 2-13 External Bus Synchronous Timing

Num	Characteristics	40 MHz		66 MHz		80 MHz		Unit
		Min	Max	Min	Max	Min	Max	
140	First CKOUT transition to Address Valid	—	6.2	—	5	—	5	ns
141	Second CKOUT transition to $\overline{\text{WR}}$ Assertion ¹							ns
	• WS = 0	—	4.4	—	4	—	4	ns
	• WS > 0	—	$T_H + 4.4$	—	$T_H + 4$	—	$T_H + 4$	ns
142	Second CKOUT transition to $\overline{\text{WR}}$ Deassertion	1.3	9.1	1	5	1	5	ns
143	Second CKOUT transition to $\overline{\text{RD}}$ Assertion	—	3.9	—	3.9	—	3.9	ns
144	Second CKOUT transition to $\overline{\text{RD}}$ Deassertion	0	3.4	–3	3	–3	3	ns
145	First CKOUT transition to Data-Out Valid	—	5.4	—	4.5	—	4.5	ns
146	First CKOUT transition to Data-Out Invalid ³	0	—	0	—	0	—	ns
147	Data-In Valid to second CKOUT transition (Setup)	3.4	—	3.4	—	3.4	—	ns
148	Second CKOUT transition to Data-In Invalid (Hold)	0	—	0	—	0	—	ns
149	First CKOUT transition to Address Invalid ³	0	—	0	—	0	—	ns

- Notes:
1. AC timing specifications which are referenced to a device input signal are measured in production with respect to the 50% point of the respective input signal's transition.
 2. WS are wait state values specified in the BCR.
 3. First CKOUT transition to data-out invalid (specification # T146) and first CKOUT transition to address invalid (specification # T149) indicate the time after which data/address are no longer guaranteed to be valid.
 4. Timings are given from CKOUT midpoint to V_{OL} or V_{OH} of the corresponding pin(s).
 5. First CKOUT transition is a falling edge of CKOUT for CKP = 0.

Note: During Read-Modify-Write Instructions, the address lines do not change states.

162	\overline{BR} Assertion to second CKOUT transition for Minimum Timing	9.5	T_C	9.5	T_C	9.5	T_C	ns

Table 2-14 Bus Strobe/Wait Timing (Continued)

No.	Characteristics	40 MHz		66 MHz		80 MHz		Unit
		Min	Max	Min	Max	Min	Max	
163	\overline{BR} Deassertion to second CKOUT transition for Minimum Timing	8	T_C	8	T_C	8	T_C	ns
164	First CKOUT transition to \overline{BG} Assertion	—	8.8	—	8.8	—	8.8	ns
165	First CKOUT transition to \overline{BG} Deassertion	—	5.3	—	5.3	—	5.3	ns
170	EXTAL to CKOUT with PLL Disabled	3	9.7	3	9.7	3	9.7	ns
	EXTAL to CKOUT ⁵ with PLL Enabled and $MF < 5$	0.3	3.7	0.3	3.7	0.3	3.7	ns
171	Second CKOUT transition to \overline{BN} Assertion	—	5.7	—	5.7	—	5.7	ns
172	Second CKOUT transition to \overline{BN} Deassertion	—	5	—	5	—	5	ns

- Notes:
1. If wait states are also inserted using the BCR and if the number of wait states is greater than 2, then specification numbers T156 and T157 can be increased accordingly.
 2. \overline{BS} deassertion to address invalid indicates the time after which the address are no longer guaranteed to be valid.
 3. The minimum number of wait states when using $\overline{BS}/\overline{WT}$ is two (2).
 4. For read-modify-write instructions, the address lines will not change states between the read and the write cycle. However, \overline{BS} will deassert before asserting again for the write cycle. If wait states are desired for each of the read and write cycle, the \overline{WT} pin must be asserted once for each cycle.
 5. When EXTAL frequency is less than 33 MHz, then timing T170 is not guaranteed for a period of $1000 \times T_C$ after PLOCK assertion following the events below:
 - when enabling the PLL operation by software,
 - when changing the Multiplication Factor,
 - when recovering from the Stop state if the PLL was turned off and it is supposed to turn, on
 - when exiting the Stop state.

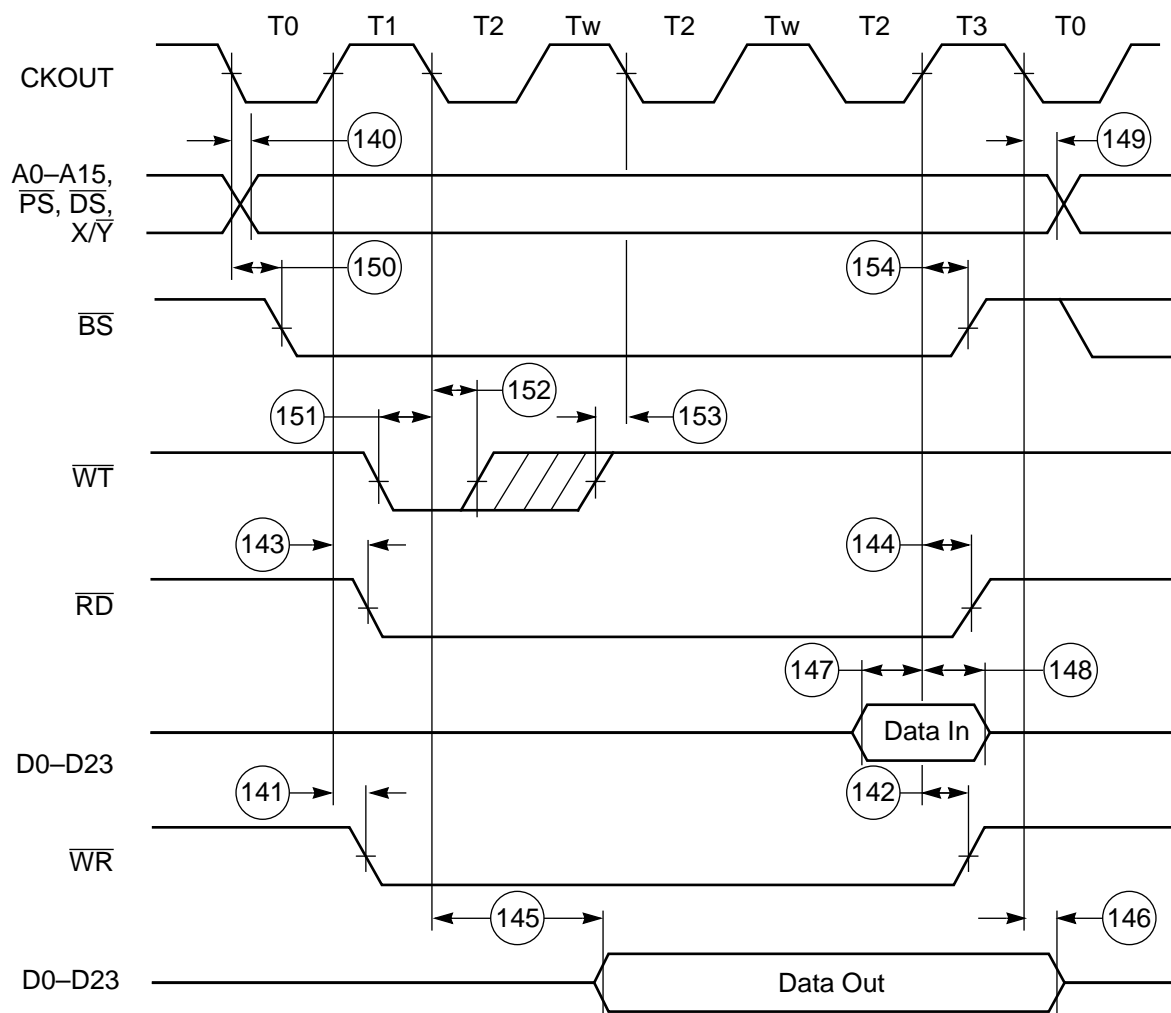

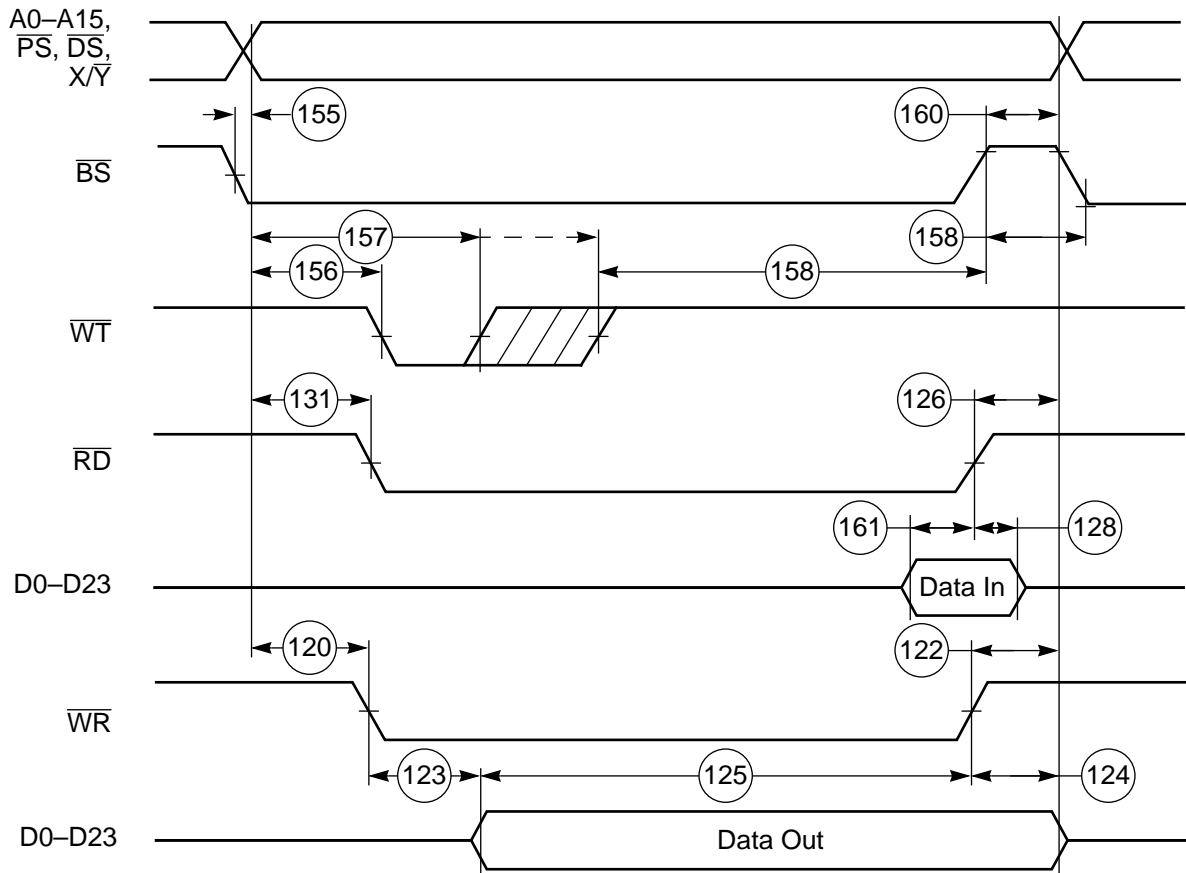

Figure 2-24 Synchronous Bus Request / Bus Grant Timing

Note: During Read-Modify-Write instructions, the address lines do not change state. However, \overline{BS} will deassert before asserting again for the write cycle.

AA0397

Figure 2-25 Synchronous \overline{BS} / \overline{WT} Timings

Note: During Read-Modify-Write instructions, the address lines do not change state. However, \overline{BS} will deassert before asserting again for the write cycle.

	• Stable External Clock, OMR Bit 6 = 1	$25T_C + T_L$	—	ns
	• Stable External Clock, PCTL Bit 17 = 1	$18T_C + T_L$	—	ns
Notes: 1. A clock stabilization delay is required when using the on-chip crystal oscillator in two cases: <ul style="list-style-type: none"> • after power-on Reset, and • when recovering from Stop mode. During this stabilization period, T_C , T_H , and T_L will not be constant. Since this stabilization period varies, a delay of $75,000 \times T_C$ is typically allowed to assure that the oscillator is stable before executing programs. While it is possible to set OMR bit 6 = 1 when using the internal crystal oscillator, it is not recommended and these specifications do not guarantee timings for that case. 2. The maximum specified is periodically sampled and not 100% tested.

SECTION 3

PACKAGING

PIN-OUT AND PACKAGE INFORMATION

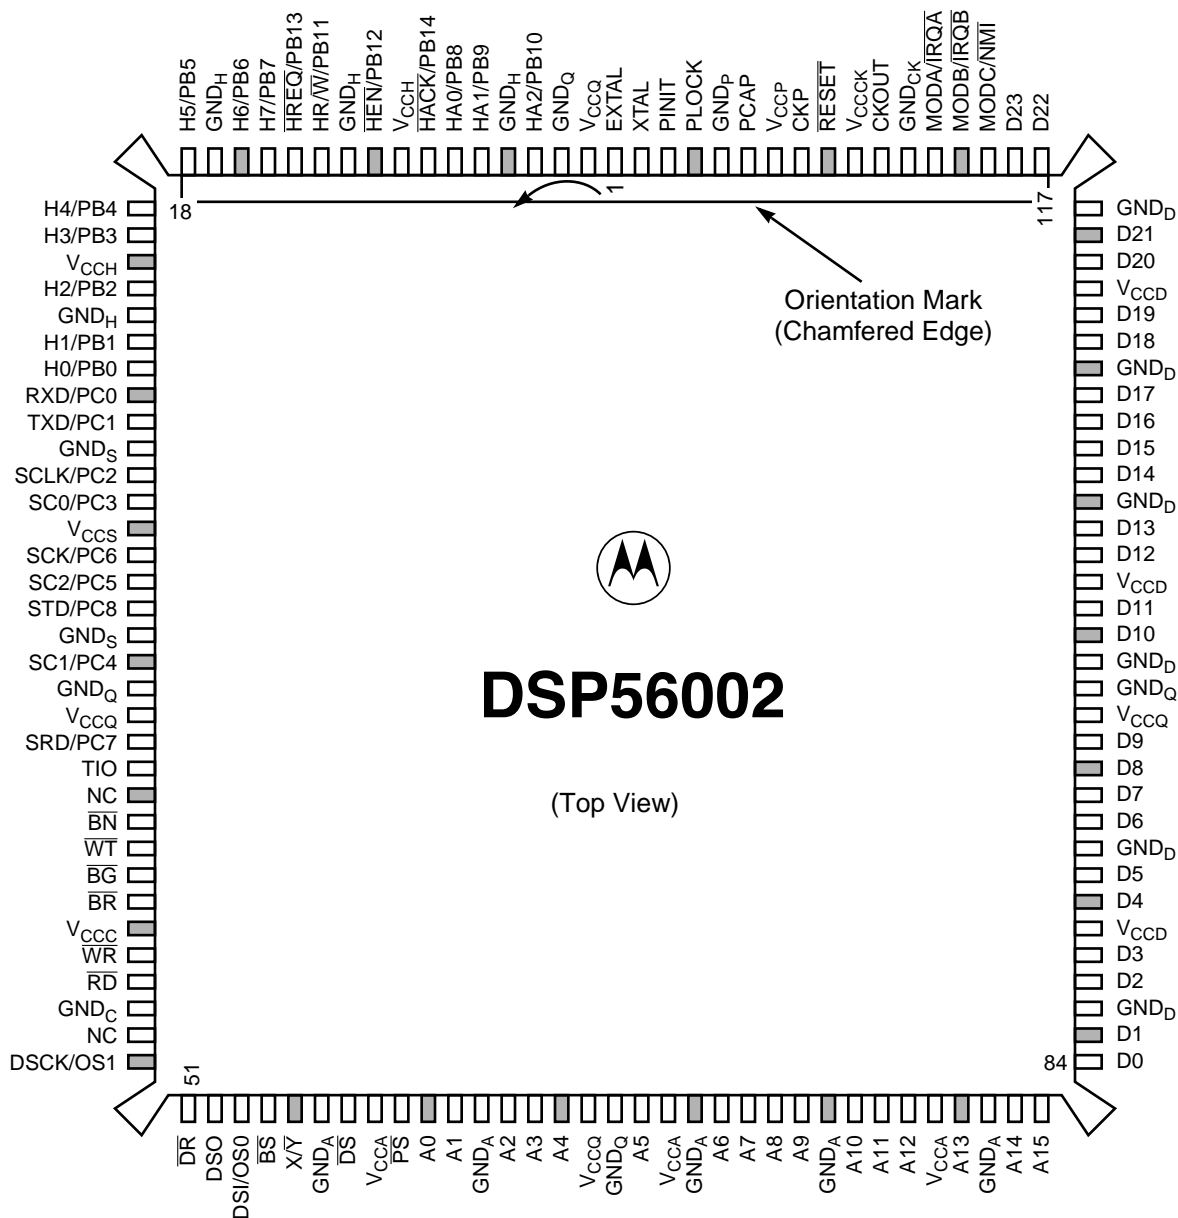

This sections provides information about the available packages for this product, including diagrams of the package pinouts and tables describing how the signals described in **Section 1** are allocated for each package.

The DSP56002 is available in three package types:

- 132-pin Plastic Quad Flat Pack (PQFP)
- 144-pin Thin Quad Flat Pack (TQFP)
- 132-pin Ceramic Pin Grid Array (PGA)

PQFP Package Description

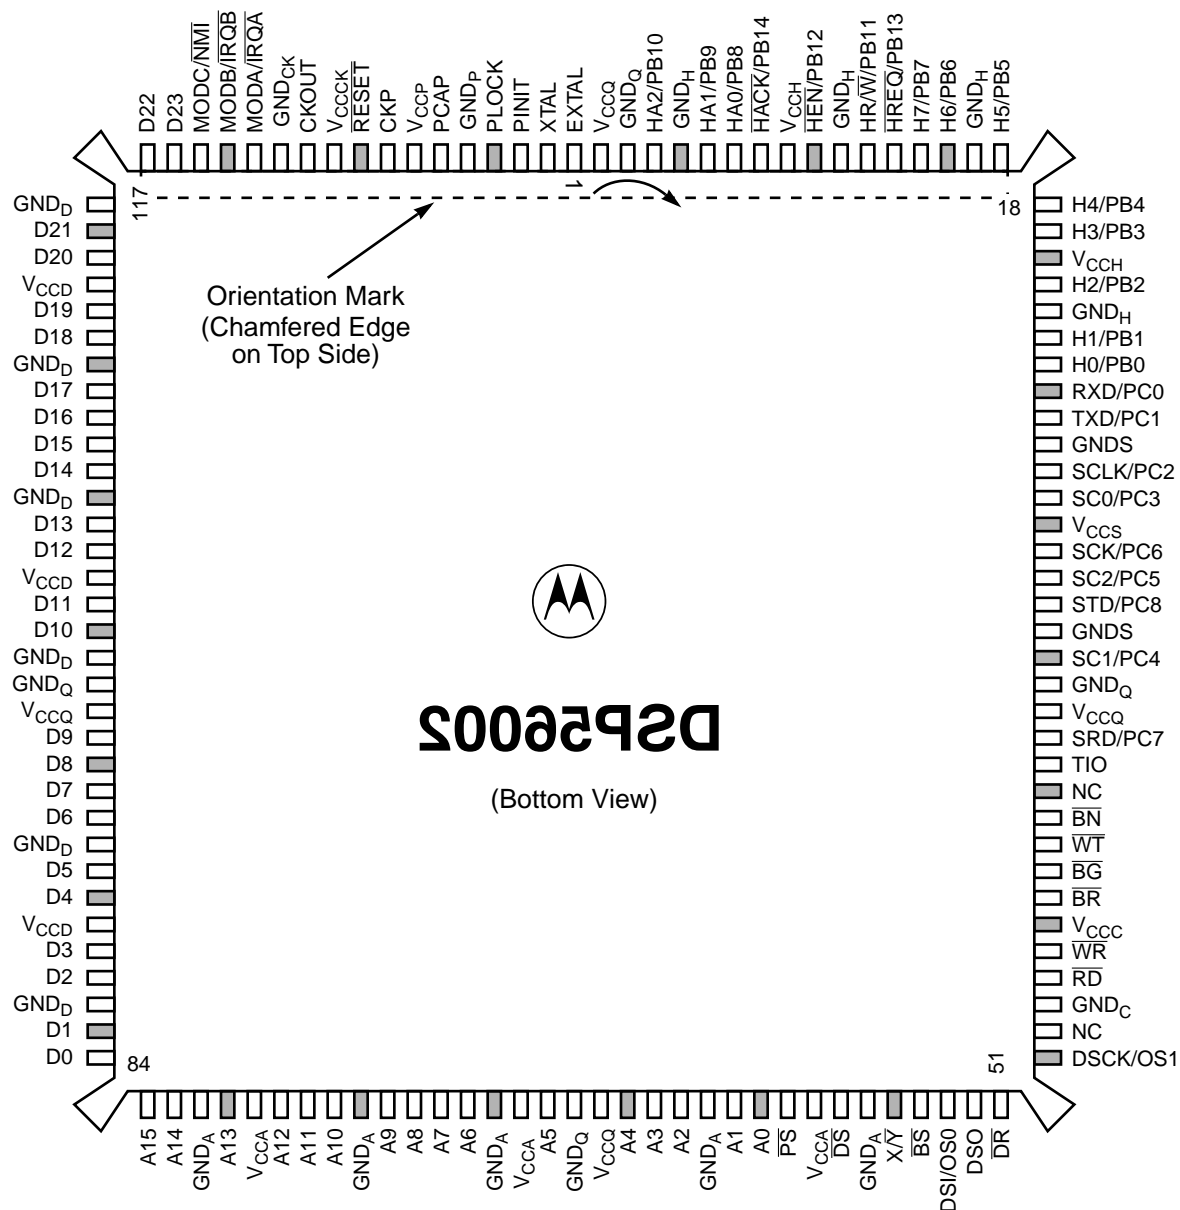

Top and bottom views of the PQFP package are shown in **Figure 3-1** and **Figure 3-2** with their pin-outs.

- Note:
1. "NC" are No Connection pins that are reserved for possible future enhancements. Do not connect these pins to any power, ground, signal traces, or vias.
 2. An OVERBAR indicates the signal is asserted when the voltage = ground (active low).
 3. To simplify locating the pins, each fifth pin is shaded in the illustration.

AA0611

Figure 3-1 Top View of the 132-pin Plastic Quad Flat Pack (PQFP) Package

- Note:
1. "NC" are No Connection pins that are reserved for possible future enhancements. Do not connect these pins to any power, ground, signal traces, or vias.
 2. An OVERBAR indicates the signal is asserted when the voltage = ground (active low).
 3. To simplify locating the pins, each fifth pin is shaded in the illustration.

**Figure 3-9** 132-pin Ceramic Pin Grid Array (PGA) Package Mechanical Information

ORDERING DRAWINGS

Complete mechanical information regarding DSP56002 packaging is available by facsimile through Motorola's Mfax™ system. Call the following number to obtain information by facsimile:

(602) 244-6591

The Mfax automated system requests the following information:

- The receiving facsimile telephone number including area code or country code
- The caller's Personal Identification Number (PIN)

Note: For first time callers, the system provides instructions for setting up a PIN, which requires entry of a name and telephone number.

- The type of information requested:
 - Instructions for using the system
 - A literature order form
 - Specific part technical information or data sheets
 - Other information described by the system messages

A total of three documents may be ordered per call.

The DSP56002 132-pin PQFP package mechanical drawing is referenced as 831A-02. The reference number for the 144-pin TQFP package is 918-03. The reference number for the 132-pin ceramic PGA package is 789B-01.

SECTION 4

DESIGN CONSIDERATIONS

HEAT DISSIPATION

An estimation of the chip junction temperature, T_J , in °C can be obtained from the equation:

Equation 1: $T_J = T_A + (P_D \times R_{\theta JA})$

Where:

T_A = ambient temperature °C

$R_{\theta JA}$ = package junction-to-ambient thermal resistance °C/W

P_D = power dissipation in package

Historically, thermal resistance has been expressed as the sum of a junction-to-case thermal resistance and a case-to-ambient thermal resistance:

Equation 2: $R_{\theta JA} = R_{\theta JC} + R_{\theta CA}$

Where:

$R_{\theta JA}$ = package junction-to-ambient thermal resistance °C/W

$R_{\theta JC}$ = package junction-to-case thermal resistance °C/W

$R_{\theta CA}$ = package case-to-ambient thermal resistance °C/W

$R_{\theta JC}$ is device-related and cannot be influenced by the user. The user controls the thermal environment to change the case-to-ambient thermal resistance, $R_{\theta CA}$. For example, the user can change the air flow around the device, add a heat sink, change the mounting arrangement on the Printed Circuit Board, or otherwise change the thermal dissipation capability of the area surrounding the device on a Printed Circuit Board. This model is most useful for ceramic packages with heat sinks; some 90% of the heat flow is dissipated through the case to the heat sink and out to the ambient environment. For ceramic packages, in situations where the heat flow is split between a path to the case and an alternate path through the Printed Circuit Board, analysis of the device thermal performance may need the additional modeling capability of a system level thermal simulation tool.

The thermal performance of plastic packages is more dependent on the temperature of the Printed Circuit Board to which the package is mounted. Again, if the

estimations obtained from $R_{\theta JA}$ do not satisfactorily answer whether the thermal performance is adequate, a system level model may be appropriate.

A complicating factor is the existence of three common ways for determining the junction-to-case thermal resistance in plastic packages:

- To minimize temperature variation across the surface, the thermal resistance is measured from the junction to the outside surface of the package (case) closest to the chip mounting area when that surface has a proper heat sink.
- To define a value approximately equal to a junction-to-board thermal resistance, the thermal resistance is measured from the junction to where the leads are attached to the case.
- If the temperature of the package case (T_T) as determined by a thermocouple, the thermal resistance is computed using the value obtained by the equation $(T_J - T_T)/P_D$.

As noted above, the junction-to-case thermal resistances quoted in this data sheet are determined using the first definition. From a practical standpoint, that value is also suitable for determining the junction temperature from a case thermocouple reading in forced convection environments. In natural convection, using the junction-to-case thermal resistance to estimate junction temperature from a thermocouple reading on the case of the package will estimate a junction temperature slightly hotter than actual temperature. Hence, the new thermal metric, Thermal Characterization Parameter or Ψ_{JT} , has been defined to be $(T_J - T_T)/P_D$. This value gives a better estimate of the junction temperature in natural convection when using the surface temperature of the package. Remember that surface temperature readings of packages are subject to significant errors caused by inadequate attachment of the sensor to the surface and to errors caused by heat loss to the sensor. The recommended technique is to attach a 40-gauge thermocouple wire and bead to the top center of the package with thermally conductive epoxy.

Note: Table 2-2 Thermal Characteristics on page 2-2 contains the package thermal values for this chip.

ELECTRICAL DESIGN CONSIDERATIONS

CAUTION

This device contains protective circuitry to guard against damage due to high static voltage or electrical fields. However, normal precautions are advised to avoid application of any voltages higher than maximum rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (e.g., either GND or V_{CC}).

Use the following list of recommendations to assure correct DSP operation:

- Provide a low-impedance path from the board power supply to each V_{CC} pin on the DSP, and from the board ground to each GND pin.
- Use at least four 0.1 μ F bypass capacitors positioned as close as possible to the four sides of the package to connect the V_{CC} power source to GND.
- Ensure that capacitor leads and associated printed circuit traces that connect to the chip V_{CC} and GND pins are less than 0.5 inch per capacitor lead.
- Use at least a four-layer Printed Circuit Board (PCB) with two inner layers for V_{CC} and GND.
- Because the DSP output signals have fast rise and fall times, PCB trace lengths should be minimal. This recommendation particularly applies to the address and data buses as well as the \overline{RD} , \overline{WR} , \overline{IRQA} , \overline{IRQB} , \overline{NMI} , \overline{HEN} , and \overline{HACK} pins.
- Consider all device loads as well as parasitic capacitance due to PCB traces when calculating capacitance. This is especially critical in systems with higher capacitive loads that could create higher transient currents in the V_{CC} and GND circuits.
- All inputs must be terminated (i.e., not allowed to float) using CMOS levels.
- Take special care to minimize noise levels on the PLL supply pins (both V_{CC} and GND).

POWER CONSUMPTION

Power dissipation is a key issue in portable DSP applications. The following describes some factors which affect current consumption. Current consumption is described by the formula:

Equation 3: $I = C \times V \times f$

where: C = node/pin capacitance
 V = voltage swing
 f = frequency of node/pin toggle

For example, for an address pin loaded with a 50 pF capacitance and operating at 5.5 V with a 40 MHz clock, toggling at its maximum possible rate (which is 10 MHz), the current consumption is:

Equation 4: $I = 50 \times 10^{-12} \times 5.5 \times 10 \times 10^6 = 2.75\text{mA}$

The maximum internal current value ($I_{CCI\text{-max}}$), reflects the maximum I_{CC} expected when running the code given below. This represents “typical” internal activity, and is included as a point of reference. Some applications may consume more or less current depending on the code used. The typical internal current value ($I_{CCI\text{-typ}}$) reflects what is typically seen when running the given code.

The following steps are recommended for applications requiring very low current consumption:

1. Minimize external memory accesses; use internal memory accesses instead.
2. Minimize the number of pins that are switching.
3. Minimize the capacitive load on the pins.
4. Connect the unused inputs to pull-up or pull-down resistors.

Current consumption test code:

```

                                org      p:RESET
                                jmp      MAIN
                                org      p:MAIN
                                movep    #$180000,x:$FFFD
                                move     #0,r0

                                rep      #30
                                mac      x0,y0,a x:(r0)+,x0 y:(r4)+,y0
                                move     a,p:(r5)
                                jmp      TP1
TP1                             nop
                                jmp      MAIN
```

HOST PORT CONSIDERATIONS

Careful synchronization is required when reading multibit registers that are written by another asynchronous system. This is a common problem when two asynchronous systems are connected. The situation exists in the host interface. The following paragraphs present considerations for proper operation.

Host Programming Considerations

UNSYNCHRONIZED READING OF RECEIVE BYTE REGISTERS

When reading receive byte registers (RXH, RXM, and RXL) the host programmer should use interrupts or poll the RXDF flag that indicates that data is available. This assures that the data in the receive byte registers will be stable.

OVERWRITING TRANSMIT BYTE REGISTERS

The host programmer should not write to the transmit byte registers (TXH, TXM, and TXL) unless the TXDE bit is set indicating that the transmit byte registers are empty. This guarantees that the transmit byte registers will transfer valid data to the HRX register.

SYNCHRONIZATION OF STATUS BITS FROM DSP TO HOST

HC, HREQ, DMA, HF3, HF2, TRDY, TXDE, and RXDF status bits are set or cleared from inside the DSP and read by the host processor. The host can read these status bits very quickly without regard to the clock rate used by the DSP, but the possibility exists that the state of the bit could be changing during the read operation. This is generally not a system problem, since the bit will be read correctly in the next pass of any host polling routine.

Note: Refer to *DSP56002 User's Manual* sections describing the I/O Interface and Host/DMA Interface Programming Model for descriptions of these status bits.

OVERWRITING THE HOST VECTOR

The Host programmer should change the Host Vector register only when the Host Command bit (HC) is clear. This change guarantees that the DSP interrupt control logic will receive a stable vector.

CANCELLING A PENDING HOST COMMAND EXCEPTION

The host processor may elect to clear the HC bit to cancel the Host Command Exception request at any time before it is recognized by the DSP. Because the host does not know exactly when the exception will be recognized (due to exception processing synchronization and pipeline delays), the DSP may execute the Host Command Exception after the HC bit is cleared. For these reasons, the HV bits must not be changed at the same time the HC bit is cleared.

VARIANCE IN THE HI TIMING

HI timing may vary during initial startup during the time after reset before the PLL locks. Therefore, before a host attempt to load (i.e., bootstrap) the DSP, the host should first make sure that the HI port programming has been completed. The following steps can be used to ensure that the programming is complete:

1. Set the INIT bit in the ICR
2. Poll the INIT bit until it is cleared.
3. Read the ISR.

An alternate method is:

1. Write the TREQ/RREQ together with INIT.
2. Poll INIT, ISR, and the $\overline{\text{HREQ}}$ pin.

DSP Programming Considerations

SYNCHRONIZATION OF STATUS BITS FROM HOST TO DSP

DMA, HF1, HF0, and HCP, HTDE, and HRDF status bits are set or cleared by the host processor side of the interface. These bits are individually synchronized to the DSP clock.

Note: Refer to *DSP56002 User's Manual* sections describing the I/O Interface and Host/DMA Interface Programming Model for descriptions of these status bits.

READING HF0 AND HF1 AS AN ENCODED PAIR

A potential problem exists when reading status bits HF0 and HF1 as an encoded pair (i.e., the four combinations 00, 01, 10, and 11 each have significance). A very small probability exists that the DSP will read the status bits synchronized during transition. The solution to this potential problem is to read the HF0 and HF1 bits twice and check for consensus.

PACKAGE COMPATIBILITY

The PQFP and TQFP packages are designed so that a single Printed Circuit Board (PCB) can accommodate either package. The two package pinouts are similarly sequenced. Proper orientation of each package with the smaller TQFP footprint inside the PQFP footprint allow connection of PCB traces to either package. For example, the D0 pin is near the corner of both the PQFP package (pin 84) and the TQFP package (pin 109), and is adjacent to D1 on both packages.

Note: Some “no connect” pins in the TQFP pin sequence are excluded from the PQFP pin sequence.

SECTION 5

ORDERING INFORMATION

DSP56002 ordering information in the table below lists the pertinent information needed to place an order. Consult a Motorola Semiconductor sales office or authorized distributor to determine availability and to order parts.

Table 5-1 DSP56002 Ordering Information

Part	Supply Voltage	Package Type	Pin Count	Frequency (MHz)	Order Number
DSP56002	5 V	Plastic Quad Flat Pack (PQFP)	132	40	DSP56002FC40
				66	DSP56002FC66
				80	DSP56002FC80
		Plastic Thin Quad Flat Pack (TQFP)	144	40	DSP56002PV40
				66	DSP56002PV66
				80	DSP56002PV80
		Ceramic Pin Grid Array	132	40	DSP56002RC40
